## Security

40% of forced entries into houses last year were made through downstairs casement windows.

It can take as little as 20 seconds to jemmy open a typical window lock. If that doesn't work, most ordinary friction hinges can be levered open just as easily.

At the turn of a handle a centre deadlock secures the window, as well as shoot bolts which locate into nylon composite keeps, secured to the window frame. The bolts themselves are made from high strength alloy, making the window virtually impossible to force open

### Saracen Hinges

Saracen friction hinges are made of high grade stainless steel, and lock deep into end caps made from ICI Verton - material used in aerospace and automotive industries.

All of this makes the hinge 4 times more resistant to attack than conventional hinges.

### Residential Doors

As standard insurance approved locks are fitted to all our doors, our locks feature twin tapered hooks, rollers & robust central dead bolt. The rollers smoothly guide the hook into position enabling the inward facing hooks with 28mm projection to secure the door into the frame.

Handles lock automatically when shut, but open at the press of a button for extra safety in the case of fire.

### Extra Security

Extra Security comes as standard with glazing beads fitted internally - preventing the removal of the glass from the outside.
